EXPERIMENT 5

NAME:NITHYA SHREE S

ROLL NO:240701367

Task Analysis, User Flow Design, and Wireframe Development for an Movie Ticket Booking System:

Task Analysis:

Task Analysis is the process of breaking down a user's interaction with the Movie Ticket Booking System into smaller steps to understand how users book tickets easily and efficiently. It helps identify user needs, difficulties, and areas for improvement.

Key Aspects of Task Analysis:

• Understanding how users search and book movie tickets.
• Identifying the sequence of actions required to complete ticket booking.
• Analyzing possible user issues (seat availability, payment failure, etc.).
• Defining system requirements to improve user experience.

User Flow:

User Flow is a visual representation of how users navigate through the Movie Ticket Booking System to complete ticket booking.

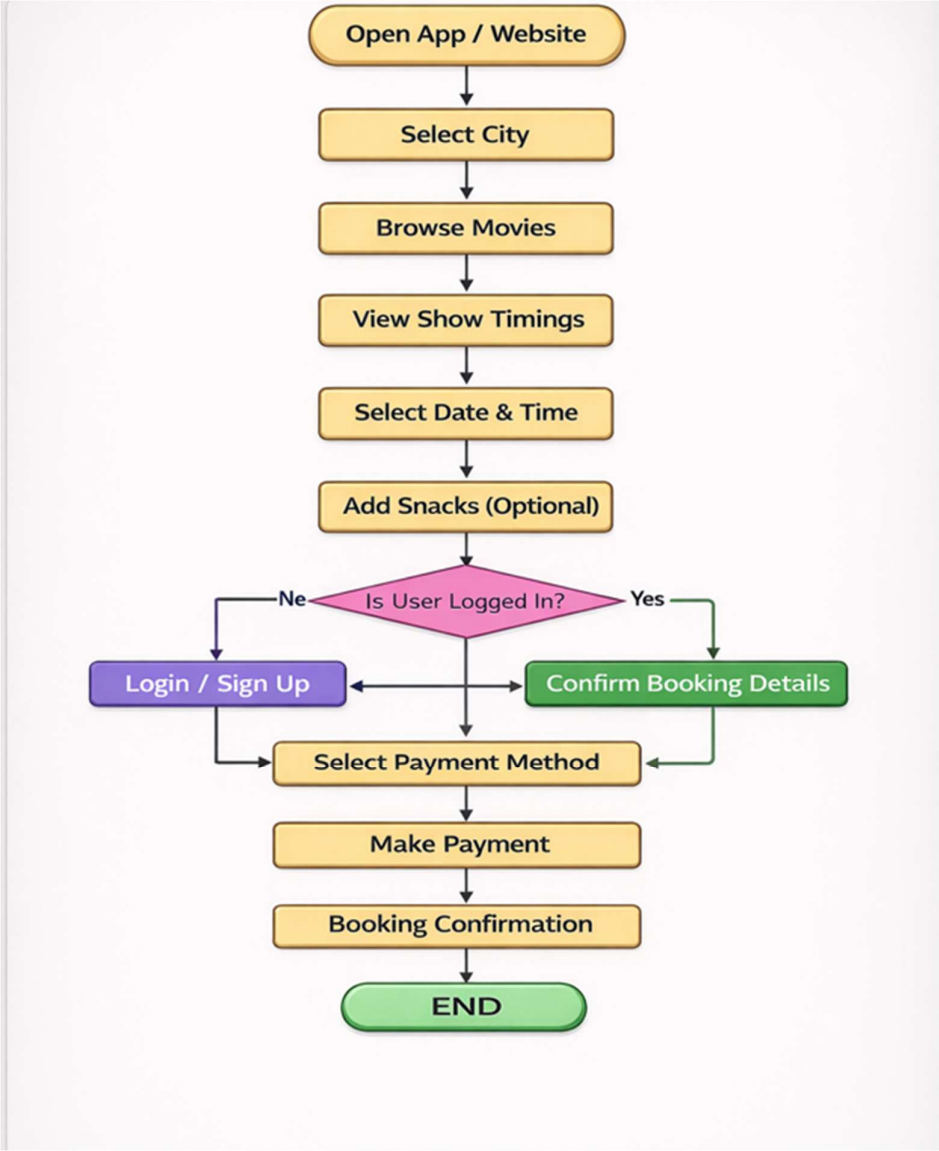
Key Aspects of User Flow:

• Shows decision-making paths (e.g., what happens if payment fails?).
• Maps different navigation options (search by movie, theatre, or city).
• Displays how users move between screens.

User Flow for Movie Ticket Booking System:

Start → Open App/Website → Login/Register → Select City → Browse Movies →
Select Movie → View Show Timings → Select Date & Time → Select Seats →
Add Snacks (Optional) → Proceed to Payment → Choose Payment Method →
Payment Confirmation → Ticket Confirmation → Download/Show E-Ticket → End

User Flow for an Movie Ticket Booking System:



Step-by-Step Explanation:

Step 1: Start

• User opens the Movie Ticket Booking application or website.

Step 2: Login or Register

• Existing users log in.
• New users register with email/mobile number.

Step 3: Select City

• User selects their location to view nearby theatres.

Step 4: Browse Movies

• User can browse currently running movies.
• They can filter by language, genre, or rating.

Step 5: Select Movie

• Clicking a movie opens detailed information (cast, duration, rating).

Step 6: Select Date & Show Time

• User selects preferred date and show timing.

Step 7: Select Seats

• Available seats are shown.
• User selects desired seats.
• If seats are unavailable, user must choose different seats.

Step 8: Add Snacks (Optional)

• User can add food and beverages to the order.

Step 9: Payment Process

• User selects payment method:

- Credit/Debit Card

- UPI
- Net Banking
- Wallet

Step 10: Payment Confirmation

• If payment is successful → Ticket is generated.
• If payment fails → User retries payment.

Step 11: Ticket Confirmation

• Booking details are displayed.
• E-ticket is generated with QR code.

Step 12: End of Process

• User downloads ticket or shows QR code at theatre.

WIREFRAME DESIGN:

Wireframes are simplified visual representations of the user interface that illustrate the layout and structure of an application. They focus on the arrangement of elements such as navigation bars, buttons, images, seat layouts, and ticket details without emphasizing colors or final design.

In this experiment, wireframes were created for the **Movie Ticket Booking System** to represent the main screens involved in the booking process.

These wireframes help visualize how users interact with the system while browsing movies, selecting theatres, choosing seats, making payments, and confirming bookings

WIREFRAME SCREENS DESCRIPTION:

The following wireframes were designed for the Movie Ticket Booking System to represent different stages of the user journey.

1. Choose Movie Screen:

This screen allows users to browse and select movies available in the application. It displays different movie categories such as **Now Playing**, **Coming Soon**, and **Top Movies**. A search bar is provided at the top to help users quickly find a specific movie. Each movie is displayed with a poster image that users can tap to view more details.

2. Movie Details Screen:

The movie details screen displays complete information about the selected movie. It includes the **movie poster, title, description, and storyline**. Users can also view available dates and showtimes for the movie. From this screen, the user selects a preferred date and time for booking tickets.

3. Showtime Selection Screen:

This screen allows users to select the **date and time of the movie show**. Different time slots are displayed as clickable buttons such as **16:00, 17:00, 18:00, 19:00, and 20:00**. The selected date and time are highlighted. After choosing the preferred showtime, the user can proceed with the **reservation option**.

4. Seat Selection Screen:

The seat selection screen shows the **theatre seating layout**. Seats are categorized based on availability:

• **Available Seats** – seats that can be booked
• **Reserved Seats** – seats that are already booked
• **Selected Seats** – seats chosen by the user

Users can select their preferred seats by tapping on the seat icons. The screen also displays **booking details such as date, time, seat**

numbers, and total price. Finally, the user can confirm the booking by clicking the **Buy button**.

5. Payment and Ticket Confirmation:

After successful payment, the system confirms the booking and generates the **movie ticket**. The ticket may include **movie name, theatre details, showtime, seat numbers, and QR code for entry**.

6. Ticket Booking Summary:

After selecting seats, the system displays a summary including:

• Movie name
• Show date and time
• Selected seats
• Ticket price

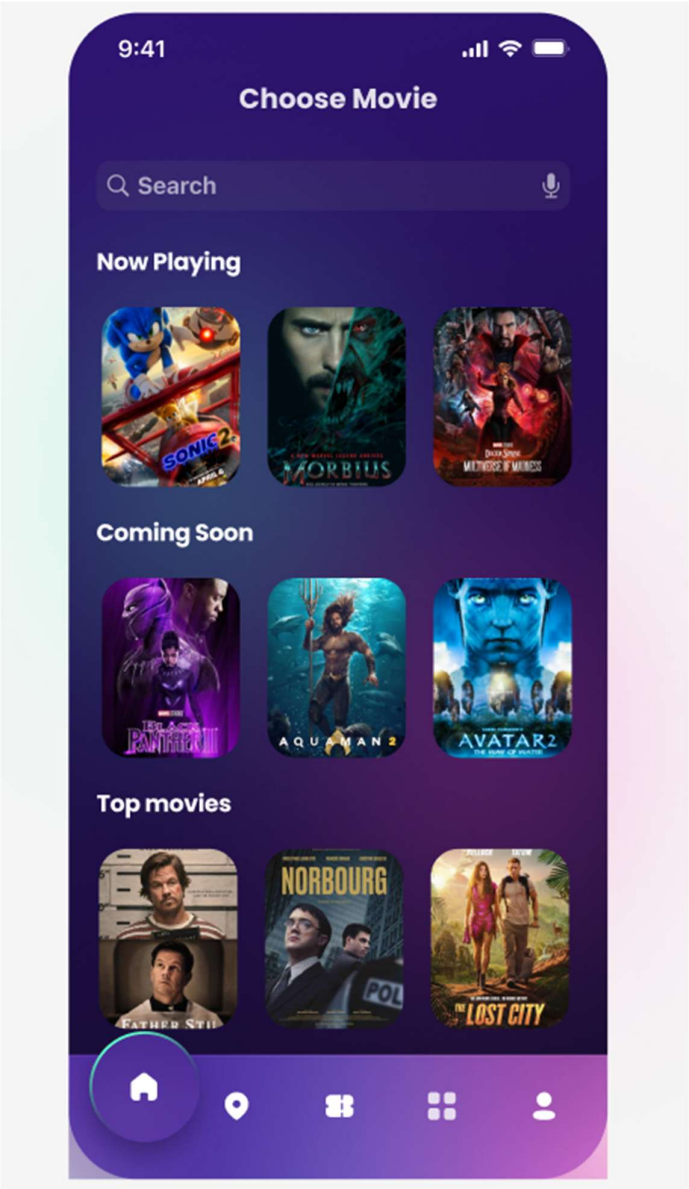
This helps users verify their booking details before completing the purchase.

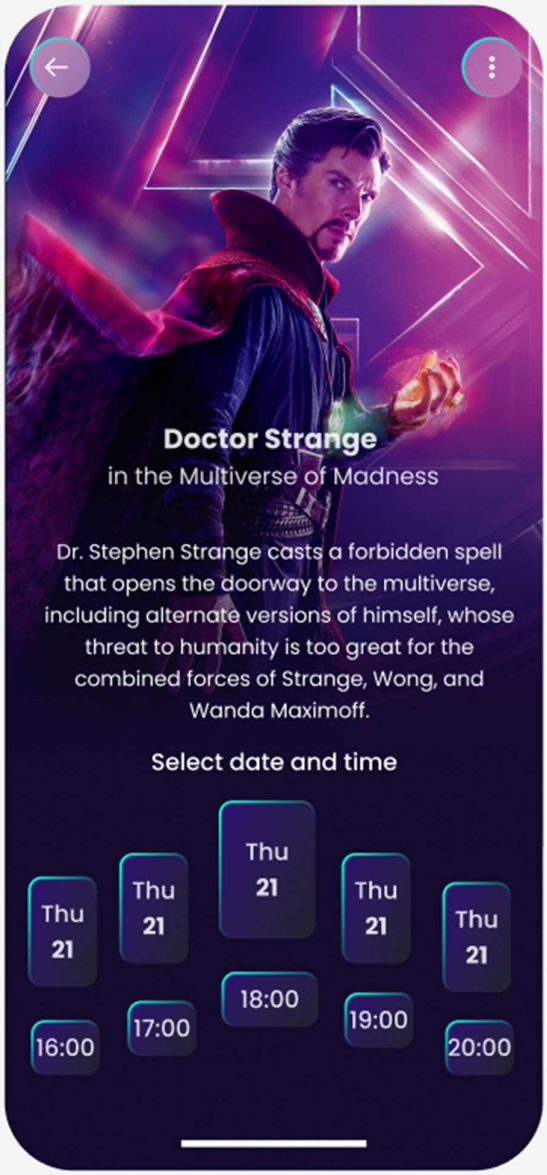
WIREFRAME IMPLEMENTATION:

The wireframes were created using design tools to represent the structure and layout of the movie ticket booking application.

These wireframes help developers and designers understand the interaction flow and improve the usability of the application before implementing the final interface.

WIRE FRAME OUTPUT:





Doctor Strange
in the Multiverse of Madness
Dr. Stephen Strange casts a forbidden spell that opens the doorway to the multiverse, including alternate versions of himself, whose threat to humanity is too great for the combined forces of Strange, Wong, and Wanda Maximoff.

RESULT:

The wireframes for the **Movie Ticket Booking System** were successfully designed to represent the layout and structure of the user interface. These wireframes demonstrate how users navigate through different screens including login, browsing movies, selecting theatres, choosing seats, making payments, and confirming ticket bookings.

This experiment improved the understanding of **user interface design principles and user interaction flow in a movie ticket booking application**.
